## How To Perform Color Calibration

### Perform Color Calibration

Several factors influence printer performance, including temperature, humidity, air pressure, and the chemical characteristics of the paper and coatings. The printer must form an electrostatic image on the paper, which depends on the ability of the air to hold and transfer electrical charges. The paper and coatings must hold an electrical charge in the areas where the toner must adhere.

*To optimize the performance of the printer, perform the Color Calibration procedure:*

1. Press the [Machine Status] button on the Control Panel.
2. Select the [Tools] tab on the Touch Screen.
3. Select the [Troubleshooting] button.
4. Select [Calibration], then [Print Calibration], and then select [Next].
5. Follow the on-screen instructions to run the Color Calibration procedure.
